Technical University of Crete School of Electrical and Computer Engineering

Course: Wireless Communications 2022-2023

Exercise 2 (120/1000)

Report Delivery Date: 24 November 2022

Instructor: Athanasios P. Liavas

Student: Alevrakis Dimitrios 2017030001

Part 1 1 The block fading channels are created as described below:

$$\begin{array}{lll} h \, = \, \mathbf{zeros} \, (M,N) \, ; \\ & \quad \mbox{for } \operatorname{div} \, = \, 1 \, : \, M \\ & \quad \ \, h \, (\operatorname{div} \, , : \,) \, = \, (\mathbf{randn} \, (1 \, , N) \, + \, 1 \, i \, * \mathbf{randn} \, (1 \, , N)) \, * \, \mathbf{sqrt} \, (1/2) \, ; \\ & \quad \mbox{end} \end{array}$$

Where M the desired diversity, meaning the number of receive antennae.

2 The transmitted 4-QAM symbols are created as described below:

$$s = 1 - (randi(2,[1,N]) - 1) * 2 + 1i * (1 - (randi(2,[1,N]) - 1) * 2);$$

3 The White Gaussian noise is created as described below:

```
\begin{array}{ll} n = \mathbf{zeros}\left(M,N\right); \\ & \textbf{for} \ \operatorname{div} = 1 \colon\!\! M \\ & n\left(\operatorname{div},:\right) = (\ \mathbf{randn}(1\,,\!N) \ + \ 1\,\mathrm{i} * \mathbf{randn}(1\,,\!N) \ ) * \mathbf{sqrt}\left(N_{-}0\,/\,2\right); \\ & \textbf{end} \end{array}
```

Therefore the received signal on each antenna is:

```
\begin{array}{rl} r \, = \, \mathbf{zeros} \, (M,N) \, ; \\ & \mbox{ for } \operatorname{div} \, = \, 1 \! : \! M \\ & \mbox{ } r \, (\operatorname{div} \, , :) \, = \, h \, (\operatorname{div} \, , :) \, . \, * \, s \, \, + \, n \, (\operatorname{div} \, , :) \, ; \\ & \mbox{ end } \end{array}
```

The transmitted signal power:

$$P_{TX} = \mathcal{E}[s^2] = \frac{1}{N} \sum_{i=1}^{N} |s_i|^2 = \frac{1}{N} \sum_{i=1}^{N} |\pm 1 \pm i|^2 = \frac{1}{N} \sum_{i=1}^{N} 2 = 2$$

Therefore the SNR in this case:

$$SNR_{db} = 10log_{10} \frac{P_{TX}}{P_{noise}} = 10log_{10} \frac{2}{N_0}$$

In order to get the desired SNR:

$$N_0 = \frac{2}{10^{\frac{SNR_{db}}{10}}}$$

4 Using the Maximum Ratio Combining(MRC) method we define:

$$R \coloneqq \frac{\mathbf{h}^H}{||\mathbf{h}||} \mathbf{Y}$$

and decide using the Maximum Likelihood(ML) method

$$\mathbf{x}^* = \min_{\mathbf{X}} ||\mathbf{R} - \mathbf{X}||^2$$

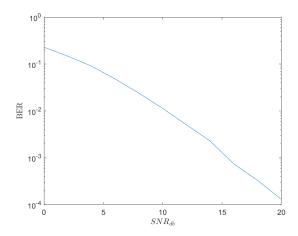

Figure 1: MRC method: BER for $SNR_{db} = [0:2:20]$

5

6 The theoretical BER:

$$BER_{Theoretical} = \begin{pmatrix} 2M - 1 \\ M \end{pmatrix} \frac{1}{4^M SNR_{db}^M}$$

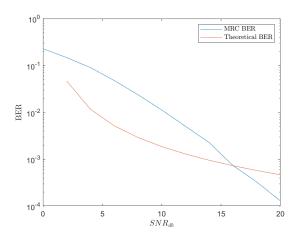

Figure 2: MRC method: Experimental and Theoretical BER for $SNR_{db} = [0:2:20]$

- 7 Steps 1-2 are executed the same as before.
 - In the Transmit Beamforming method the received signal is considered to be:

$$Y = ||\mathbf{h}||X + W$$

• Using ML we decide the received signal:

$$\mathbf{x}^* = \min_{\mathbf{X}} ||Y - \mathbf{X}||^2$$
